1.4 Sonic Reference

- [Philippine Percussion Sound Model](#) — what the ensemble should sound like

2 Concept Library

2.1 Purpose

The Concept Library defines the musical, educational, arranging, visual, and cultural concepts used throughout the project.

Each mature concept should explain:

- definition;
- purpose;
- project application;
- practical implementation;
- relationships to other concepts.

2.2 1. Syncopation in the Philippine Context

2.2.1 Definition

Syncopation places accents or stresses on weak beats, subdivisions, or spaces between expected strong beats.

2.2.2 Project Application

Syncopation is a major source of forward motion in Philippine festival drumming. Native bass-drum and ensemble patterns may avoid or displace expected downbeats, producing a street-oriented, danceable momentum through [syncopated push-and-pull](#).

2.2.3 Fusion Role

The project preserves native offbeat and displaced-accent patterns as the underlying canvas while placing precise DCI-inspired rudimental structures above them.

2.2.4 Related Concepts

- [Groove construction](#)
- [Bass-drum voicing](#)
- Accent grids (see [Grid Exercises](#))
- Tension and release
- [Syncopated Push-and-Pull](#)
- Metric contrast

2.3 2. Split Orchestration for Marching Tenors

2.3.1 Definition

Split orchestration divides a continuous phrase among multiple performers so individual notes interlock into one musical line.

2.3.2 Musical and Visual Effects

Splitting can create:

- speed beyond the practical limit of one performer;
- pitch movement across a section;
- a physical wave or ripple through the line;
- coordinated ensemble responsibility.

2.3.3 Application with Quads or Quints

Players may divide fast passages, melodic runs, or accompaniment figures while collectively acting as one multi-tonal voice.

2.3.4 Application with Single Sling Tenors

When each performer has only one drum, differently sized drums can be assigned different pitches. Passing a phrase across the section creates a rolling multi-tonal melody from single-note instruments.

2.3.5 Related Concepts

- [Voice leading \(Specifications\)](#)
- [Tenor writing \(Specifications\)](#)
- [Ensemble timing](#)
- [Visual design](#)
- Instrument adaptation

2.4 3. Marching Percussion Notation Strategy

2.4.1 Definition

A standardized notation approach that prioritizes readable parts, accurate playback, consistent player assignments, and future maintainability.

2.4.2 Offbeat Notation

Use ties, rests, beams, and subdivisions clearly enough that performers can see the pulse while MuseScore reproduces the intended syncopation accurately.

2.4.3 Split Notation

A master staff may use staff positions, noteheads, voices, labels, or explicit player directives such as P1, P2, and P3.

The final standard must distinguish clearly between:

- instrument or pitch;
- performer assignment;

- sticking;
- visual instructions.

2.4.4 Platform

MuseScore Studio 4 is the canonical notation platform for the initial stage.

See [Notation Standards \(Specifications\)](#) for authoritative notation rules as they are developed.

2.5 4. Philippine Festival Rhythms

2.5.1 Definition

Rhythmic vocabulary derived from Philippine community and festival percussion, characterized by forward motion, syncopation, audience-oriented energy, and danceable momentum.

2.5.2 Project Application

Festival rhythms provide the underlying canvas (Layer A — the soul) for all fusion writing. Bass-drum syncopation, ensemble interaction, and ceremonial pacing from festivals inform groove construction.

2.5.3 Related Concepts

- [Syncopation in the Philippine Context](#)
- [Interlocking Rhythms](#)
- [Community Performance Traditions](#)
- [Kaamulan Festival \(Research\)](#)

2.6 5. Interlocking Rhythms

2.6.1 Definition

A compositional and performance practice in which multiple performers or voices combine partial patterns into a single collective groove.

2.6.2 Project Application

Interlocking appears in indigenous Philippine percussion and festival traditions. Modern battery writing may distribute interlocking figures across snares, tenors, and bass lines while preserving the collective-groove effect.

See [Indigenous Philippine Percussion — Interlocking Rhythms \(Research\)](#) for research notes.

2.6.3 Related Concepts

- [Indigenous Philippine Percussion \(Research\)](#)
- [Call and Response](#)
- [Split Orchestration for Marching Tenors](#)

2.7 6. Call and Response

2.7.1 Definition

A musical dialogue in which one voice or group presents a phrase and another answers, creating rhythmic communication and ensemble awareness.

2.7.2 Project Application

Call-and-response informs rehearsal methodology, [crowd engagement \(Specifications\)](#), and sectional communication. It connects indigenous roots to modern battery interaction.

See [Indigenous Philippine Percussion — Call-and-Response \(Research\)](#) for research notes.

2.7.3 Practical Implementation

Use these steps when introducing call-and-response in school battery or Drum & Lyre contexts. Start simple; add notation only after the ear-led dialogue is secure.

1. Establish roles before reading

- **Caller** — usually bass and cymbals, or one section leader, states a short 1–2 bar **question** on Layer A (festival pulse intact).

- **Responder** — another section or sub-group answers with a complementary **answer** figure—not a copy of the question.
- Rotate roles so students hear both leadership and listening.

2. Start with two-bar question / two-bar answer

- Keep the question on bass-led [push-and-pull](#); let the answer push forward into a cadence or unison impact.
- See Syncopated Push-and-Pull — Example 5 for a notated starting pattern.
- Match phrase-level dialogue in the [Sound Model — Phrase Architecture](#).

3. Rehearsal checks (audible and visible)

- Can the answer section enter **without rushing** the downbeat?
- Does the answer feel like a **response**, not a random fill?
- After the exchange, can the ensemble reunite on **one collective impact**?
- In parade or standstill, does the moment read as **audience-facing** (see [Community Performance Traditions](#))?

4. Expand gradually

- Snare asks, tenors answer; then reverse.
- Half-line vs. half-line trade before full-section unison.
- Add Layer B density only **after** the call-and-response groove is stable at Layer A.

5. Respect and limits

- Adapt **dialogue function** (ask, answer, reunite)—do not imitate indigenous instrument roles or ceremonial calls without community guidance.
- Document local habits in the [Project Journal \(AI and Development\)](#); MONHS instructors should note what already works in Drum & Lyre rote teaching (see [Instructor Introduction \(User Guides\)](#)).

Pilot note (MONHS 2026): Confirm which call-and-response figures instructors already teach by ear before freezing them in written battery parts.

2.7.4 Related Concepts

- [Community Performance Traditions](#)
- [Interlocking Rhythms](#)
- [Crowd engagement \(Specifications\)](#)

2.8 7. Translate Musical Ideas—Not Instruments

2.8.1 Definition

The principle that modern battery writing should translate indigenous musical concepts—groove, phrasing, interaction, dynamics, and energy—into contemporary marching percussion rather than imitating indigenous instruments.

2.8.2 Project Application

Articulation, layering, and ensemble communication from hand-drum traditions inform battery texture without claiming to reproduce native instruments on modern drums.

2.8.3 Related Concepts

- [Indigenous Philippine Percussion \(Research\)](#)
- [Indigenous Percussion Performance Practices \(Research\)](#)
- [Native Instruments](#)

See [Identity Framework \(Specifications\)](#).

2.9 8. Traditional Drum & Lyre Evolution

2.9.1 Definition

The modernization path from recognizable Philippine Drum & Lyre grooves and performance energy toward improved technique, pedagogy, arranging, notation, and ensemble balance.

2.9.2 Project Application

Preserve: recognizable grooves, energetic performance, educational accessibility, and audience connection.

Improve: technique, pedagogy, arranging, notation, rehearsal methods, and ensemble balance.

2.9.3 Related Concepts

- [Philippine Festival Rhythms](#)

- Educational scaffolding (User Guides)
- Progressive skill development (User Guides)

2.10 9. Community Performance Traditions

2.10.1 Definition

Performance practices rooted in Philippine community and festival contexts, emphasizing participation, celebration, movement, and direct audience connection.

2.10.2 Project Application

Community traditions influence visual design, performance energy, and the project's refusal to treat percussion as detached from its social context.

2.10.3 Related Concepts

- [Philippine Festival Rhythms](#)
- [Movement and Dance](#)
- [Crowd engagement \(Specifications\)](#)

2.11 10. Philippine Rhythmic Vocabulary

2.11.1 Definition

The collection of grooves, accent patterns, syncopations, and phrase shapes that sound recognizably Filipino within the project's fusion style.

2.11.2 Project Application

Rhythmic vocabulary is taught progressively through warm-ups, grids, and cadences. It bridges rote learning and written literacy.

2.11.3 Related Concepts

- [Syncopation in the Philippine Context](#)
- [Groove construction](#)
- [Bass-drum voicing](#)

2.12 11. Movement and Dance

2.12.1 Definition

Physical movement integrated with musical phrasing, drawn from folk dance, festival choreography, indigenous performance, and visual showmanship.

2.12.2 Project Application

Movement reinforces music rather than replacing it. Influences include Tinikling-inspired weight shifts, regional dance, festival choreography, and HBCU-influenced visual contrast when adapted to Philippine identity.

2.12.3 Related Concepts

- [Community Performance Traditions](#)
- Philippine *Yabang* (see [Core Blueprint — Visual Identity \(Specifications\)](#))
- Visual design

2.13 12. Native Instruments

2.13.1 Definition

Indigenous and traditional Philippine percussion instruments whose musical roles inform—but are not literally reproduced by—modern battery writing.

2.13.2 Project Application

Study native instruments for groove, articulation, and ensemble roles. Translate ideas into battery textures per the Translate Musical Ideas—Not Instruments principle.

2.13.3 Related Concepts

- [Indigenous Philippine Percussion \(Research\)](#)
- [Indigenous Percussion Performance Practices \(Research\)](#)

2.14 13. Regional Musical Traditions

2.14.1 Definition

Distinct rhythmic, melodic, and performance practices across Philippine regions that contribute to the project's depth and diversity.

2.14.2 Project Application

Regional diversity is a strength. Research should inform vocabulary without flattening traditions into a single generic "Filipino" sound.

2.14.3 Related Concepts

- [Indigenous Philippine Percussion \(Research\)](#)
- [Kaamulan Festival \(Research\)](#)
- [Philippine Rhythmic Vocabulary](#)

2.15 14. Modernization Without Imitation

2.15.1 Definition

The project philosophy that adopts modern technique and international influences only when they strengthen Philippine identity, never as substitutes for it.

2.15.2 Project Application

When evaluating ideas, ask: "How would this sound if it had originated in the Philippines?" rather than "Can we make this sound like DCI?"

2.15.3 Related Concepts

- Identity Preservation Checklist (see [Identity Framework \(Specifications\)](#))
- [DCI battery philosophy \(Specifications\)](#) (adapt, not adopt as identity)
- [HBCU showmanship \(Specifications\)](#) (adapt, not adopt as identity)

2.16 Future Concepts

- Rudiments and hybrid rudiments

- Grid writing (see [Grid Exercises](#) and [8-8-16 Exercise](#))
- Metric modulation
- [Groove construction](#)
- [Bass-drum voicing](#)
- Cymbal vocabulary
- Stick heights
- Accent-tap systems (see [Accent-Taps](#))
- Voice leading
- Dynamic architecture
- Philippine folk-dance influence
- [HBCU showmanship \(Specifications\)](#)
- [DCI battery philosophy \(Specifications\)](#)
- [Progressive skill development \(User Guides\)](#)
- [Educational scaffolding \(User Guides\)](#)
- [Crowd engagement \(Specifications\)](#)
- [Indigenous Percussion Performance Practices \(Research\)](#) (expanded)
- Legato stroke (see [Legato Stroke](#))

3 Philippine Percussion Sound Model

Status: Draft **Owner:** Philippine Marching Percussion Fusion Project **Applies To:** Arranging, education, ensemble evaluation, and pilot validation **Last Reviewed:** 2026-07-15 **Review Frequency:** Quarterly **Authoritative:** Yes

3.1 Purpose

This document defines what makes the ensemble sound **immediately recognizable as Filipino** in the Philippine Marching Percussion Fusion style. It describes sonic characteristics—not cultural identity statements (see [Identity Framework \(Specifications\)](#)).

Use this model to:

- evaluate whether warm-ups, cadences, and show material sound like the project intends;
- guide arrangers writing in the [Arranging Guide \(User Guides\)](#);
- give MONHS pilot instructors a shared vocabulary for feedback;

- distinguish **modernization** from **imitation** in rehearsal and listening tests.

Pilot validation is ongoing. Refinements from **Indigenous Philippine Percussion (Research)** research and MONHS field work may update this document.

3.2 How to Use This Model

1. Apply the **Identity Preservation Checklist (Specifications)** first.
2. Listen for the characteristics below—groove and bass momentum matter more than rudimental display.
3. Use the **three-layer sonic map** when diagnosing arrangements.
4. Run the **evaluation checklist** before adopting new repertoire.

Identity answers *why*. **Sound model** answers *what it should sound like*. **Technique references** answer *how players execute it*.

3.3 Sonic Identity Summary

A recognizably Filipino fusion battery should present:

- **Festival-forward groove** — danceable momentum and **syncopated push-and-pull**, not straight military pulse as default
- **Bass-led foundation** — low-end heartbeat and native accent spacing audible under upper voices
- **Collective pocket** — interlocking ensemble time that feels like one community instrument
- **Clear dynamic architecture** — extreme contrast between accents and taps when technique is applied (12" vs. 3" class heights)
- **Sustained energy** — celebratory forward motion over phrase length, not only short technical bursts
- **Adapted sophistication** — DCI clarity and selected HBCU flair **inside** Philippine phrase shape, never as foreign identity

If a passage could be mistaken for a generic American drumline run without the bass and groove context, it fails this model.

3.4 Rhythmic Density

3.4.1 Target character

Density serves **groove clarity**, not maximum note count. The default texture is:

- **Moderate to high** subdivision activity in snare and tenor layers during developmental passages
- **Stable, readable** bass and cymbal pulse anchoring the grid
- **Breathing space** at phrase boundaries—festival music breathes; it does not machine-gun endlessly

3.4.2 Density by layer

Layer	Density role
Bass	Sparse to moderate; every note carries pulse or syncopation function
Cymbals	Moderate; reinforcement and energy, not continuous opaque wash
Snares	Moderate to high; rudimental activity must remain subordinate to groove
Tenors	Variable; splits and runs add color when collective groove is already secure

3.4.3 Anti-patterns

- Continuous 16th-note snare walls with no bass syncopation identity
- Density that forces players to sacrifice tap height control (see [Accent-Taps](#))
- “Busy for busy’s sake” figures that obscure festival downbeat placement

3.5 Phrase Architecture

3.5.1 Target character

Phrases follow **processional and festival logic**: build, release, answer, return—not abstract symmetrical forms copied from foreign show design.

3.5.2 Typical phrase shapes

1. **Establish groove** — bass and cymbal state the festival pulse (Layer A)
2. **Develop** — snare and tenor add precision and interlocking color (Layer B)
3. **Contrast** — breakdown, halftime, or metric shift (Layer C)—brief and purposeful
4. **Return** — explosive recovery to festival tempo and accent philosophy
5. **Cadential release** — unison impact, crowd-facing punctuation, or ceremonial pause

3.5.3 Phrase-level call-and-response

Sections or sub-groups may trade figures before reuniting on unison impact—mirroring community and festival dialogue. See [Indigenous Philippine Percussion — Call-and-Response \(Research\)](#).

3.5.4 Anti-patterns

- Phrases that climax on foreign cadential clichés with no bass-led recovery
 - Identical 4- or 8-bar loops with no ceremonial pacing variety
 - Endings that feel “competitive drum corps” rather than “community celebration”
-

3.6 Groove Characteristics

3.6.1 Target character

Collective groove is the non-negotiable center. See [Indigenous Philippine Percussion — Collective Groove \(Research\)](#).

Groove should feel:

- **danceable** — forward motion you can step to
- **syncopated** — accents displace or energize weak subdivisions; [push-and-pull](#) creates dance momentum ([Syncopation in the Philippine Context](#))
- **interlocking** — parts combine into one composite rhythm ([Interlocking Rhythms](#))
- **enduring** — tempo and pocket hold under outdoor and processional conditions

3.6.2 Regional flavor

Regional accent placement (Visayan festival push, Mindanao/Bukidnon festival character, Drum & Lyre street groove) may color the groove. Name the regional inspiration in arrangement notes when used—see [Grid Exercises](#).

3.6.3 Anti-patterns

- Straight downbeat-heavy march feel as the default identity
 - Groove that collapses when inner taps are played quietly
 - “Clean but soulless” execution—precision without festival energy
-

3.7 Accent Philosophy

3.7.1 Target character

Accents define **phrase leadership and festival energy**, not arbitrary loud notes.

3.7.2 Height hierarchy (default training targets)

Level	Approximate height	Role
Accent / rim flare	9”–12” (rim shot ^ where written)	Phrase leadership, festival flare, downbeat syncopation
Mezzo figures	6”–9”	Transitional material inside Layer B
Taps / inner notes	~3”	Subdivision integrity, sonic space for accents

See [Accent-Taps](#) and [Legato Stroke](#).

3.7.3 Accent placement

- Festival-derived **offbeat and displaced accents** are preferred canvas
- Accents should reinforce **native syncopation** and [push-and-pull](#), not fight it

- Grid and warm-up systems ([Grid Exercises](#), [8-8-16 Exercise](#)) train accent mobility across all partials

3.7.4 Anti-patterns

- Medium-height “everything loud” playing (creeping taps)
 - Accents placed for DCI visual effect only, disconnected from bass phrase
 - Rim shots or flares used without cultural and musical purpose
-

3.8 Bass Movement

3.8.1 Target character

Bass drums are the **heartbeat and festival engine**—not only downbeat markers.

3.8.2 Functional roles

- **Pulse anchor** — establishes tempo and dance momentum
- **Syncopation driver** — native offbeat and displaced patterns ([Philippine Festival Rhythms](#))
- **Low-end dialogue** — split patterns interlock across drums ([Grid Exercises — Linear Fiesta](#))
- **Cadential weight** — unison impacts and bottom-end punctuation at phrase endings

3.8.3 Writing guidance

- Layer A material must remain audible when snare and tenor add Layer B density
- Sequential bass entries (run down the line) test individual balance before ensemble split
- Bass 5 / lowest voice carries **festival low-pulse** character in split grids—not only generic unison hits

3.8.4 Anti-patterns

- Bass locked to straight quarters with no syncopation identity
- Bass drowned by snare-heavy orchestration

- Split bass figures that sound random rather than interlocking
-

3.9 Ensemble Balance

3.9.1 Target character

Balance is **role-based**, not equal dynamic across all voices.

Voice	Balance priority
Bass	Groove foundation; must project pulse and syncopation
Cymbals	Energy and reinforcement; support accents without masking bass
Snares	Articulation and rudimental color; must not obscure groove
Tenors	Melodic and interlocking color; collective voice when split

3.9.2 Blend tests

1. **Groove test** — Can you dance to the bass and cymbal alone?
2. **Tap test** — Are inner snare notes audible and rhythmically even?
3. **Split test** — Do bass splits sound like one player when combined?
4. **Unison test** — Do unison impacts align in time, height, and tone?

3.9.3 School-context realism

Balance targets must remain achievable for mixed reading levels and local instrumentation—see [Design Principles \(Specifications\)](#).

3.10 Cadence Architecture

3.10.1 Target character

Cadences are **public-facing musical statements**—short, memorable, and culturally grounded.

3.10.2 Recommended architecture (proof-of-concept and beyond)

1. **Opening statement** — festival groove in Layer A (bass-led)
2. **Development** — Layer B vocabulary over unchanged pulse
3. **Contrast moment** — brief Layer C figure (optional)
4. **Return** — festival tempo recovery
5. **Closing impact** — unison punctuation suitable for school parade or standstill performance

Aligns with **Core Blueprint — Phase 2 (Specifications)** 16-bar hybrid cadence goals.

3.10.3 Length and teachability

Initial cadences favor **short, repeatable** forms that students can internalize by ear and notation. Complexity grows across the curriculum—not in a single overwhelming chart.

3.10.4 Anti-patterns

- Cadences that are rudiment displays with no bass identity in the opening bars
 - Endings copied from foreign corps repertoire without Philippine recovery material
-

3.11 Visual-Musical Interaction

3.11.1 Target character

Visual energy **reinforces** sound—it does not replace musical identity.

3.11.2 Sonic-visual alignment

- Stick heights visible to audience must match **accent philosophy**
- Movement accents align with musical accents—not offset showmanship

- Crowd-facing moments coincide with cadential or call-and-response impacts
- *Yabang* and festival choreography draw from Philippine movement vocabulary
([Core Blueprint — Visual Identity \(Specifications\)](#))

3.11.3 Anti-patterns

- Visual tricks during quiet tap passages that break height control
 - Movement vocabulary that reads as foreign drill with Filipino music underneath
 - Sacrificing inner-note timing for exaggerated motion
-

3.12 Three-Layer Sonic Map

Maps the [Core Blueprint three-layer method \(Specifications\)](#) to listening expectations.

Layer A – The Soul (always audible)

Festival pulse · bass syncopation · cymbal energy · collective groove

Layer B – The Precision (over the soul)

Rudimental and battery vocabulary · splits · height-controlled grids

Layer C – The Contrast (selective)

Breakdown · halftime · metric shift · HBCU-influenced flair

→ must return to Layer A identity

Listening rule: If you mute Layer B and C, the remaining Layer A must still sound Filipino.

3.13 Evaluation Checklist

Use before adopting warm-ups, cadences, or show segments:

- ☐ Bass and cymbal state a recognizable festival- or street-groove pulse
- ☐ Syncopation feels danceable, not merely “correct”
- ☐ Accents and taps maintain clear height separation (no creeping taps)
- ☐ Inner notes are rhythmically even—not rushed or dragged
- ☐ Layer B figures support groove rather than obscure it
- ☐ Layer C contrast returns to festival tempo and identity

- ☐ Ensemble sounds like one collective instrument at impact moments
 - ☐ Passage would not be mistaken for generic foreign drumline material
 - ☐ Teachable for the intended student group and instrumentation
 - ☐ Passes the **Identity Preservation Checklist (Specifications)**
-

3.14 Pilot Validation

This sound model will be refined through MONHS 2026 pilot work. Instructors should note:

- What reads as authentically Filipino to local students and audiences
- Where written material fights existing ear-trained groove habits
- Which stick-height targets are practical in school rehearsal time

Record observations in the **Project Journal (AI and Development)**. Confirmed findings update this document and may migrate to the [Concept Library](#).

4 Syncopated Push-and-Pull

Status: Maintained **Owner:** Philippine Marching Percussion Fusion Project

Applies To: Groove writing, bass and battery arranging, ensemble listening

Last Reviewed: 2026-07-15 **Review Frequency:** Annual **Authoritative:** Yes

4.1 Definition

Syncopated push-and-pull is a groove feel in which accents and rests alternate to create forward dance momentum: **push** figures thrust the rhythm ahead with energetic, often offbeat accents; **pull** figures create brief tension—rests, softer partials, or displaced gaps—before the next push.

It is not merely “playing off the beat.” It is a **repeating give-and-take** that makes festival and street grooves feel propelled and danceable rather than mechanically straight.

4.2 Push vs. Pull

Term	Musical effect	Typical placement
Push	Surge of energy; dancer/performer moves forward	Accents on weak subdivisions (e, &, a), rim flares, early syncopated bass hits
Pull	Brief withholding; ear anticipates the next accent	Rests, low taps, lengthened space after a push, slight accent delay

Together they produce **tension and release inside the bar** while tempo stays steady.

4.3 Philippine Festival Context

Push-and-pull appears in Visayan and broader Philippine festival drumming where bass and ensemble accents do not sit only on marching downbeats. Native patterns create street-oriented momentum—the feel described in [Syncopation in the Philippine Context](#) and the [Sinulog-DCI Hybrid grid](#).

The [Philippine Percussion Sound Model](#) lists festival-forward **syncopated push-and-pull** as a core sonic trait.

4.4 Notation Key

Text grids in this document use the same symbols as [Accent-Taps](#) and [Grid Exercises](#):

Symbol	Meaning
>	Standard accent (9"–12")
^	Accent + rim shot / festival flare
.	Inner tap, rest, or low partial (≈3")
R / L	Right / left hand (battery examples)

Time is 4/4 unless noted. Count sixteenth subdivisions as 1 e & a.

4.5 Example 1: Straight Pulse (Contrast)

A straight march-oriented bass pattern accents predictable strong beats. It is **not** push-and-pull—useful as a contrast when teaching the feel.

Count: 1 + 2 + 3 + 4 +

Bass: > . > . > . > .

Feel: STRAIGHT – even downbeat emphasis, no offbeat surge

Listening test: The groove marches; it does not lean or dance forward on offbeats.

4.6 Example 2: Basic Bass Push-and-Pull (8th-Note Canvas)

A simple festival-style bass line: push on offbeats, pull on the following partial.

Count: 1 & 2 & 3 & 4 &

Bass: . > . ^ . > . ^

pull PUSH pull PUSH pull PUSH pull PUSH

Feel: Accents surge on & and secondary pushes (^); beats 1-2-3-4 act as pull/setup

Arranging note: Snare Layer B vocabulary must not erase this bass dialogue—inner taps stay low.

4.7 Example 3: 16th-Note Push-and-Pull (Festival Density)

A denser pattern matching the forward-shifting accent logic in grid warm-ups. Compare [Grid Exercises — Part B](#)).

Count: 1 e & a 2 e & a 3 e & a 4 e & a

Bass: ^ . . > . ^ . . ^ . . > . ^ . .

Push: ^ > ^ > ^ >

Pull:

Feel: Push on 1 and &; pull across e-a; secondary push on e of next beat

This is the accent **shape** the Sinulog-DCI hybrid grid trains—DCI heights on a Philippine syncopation map.

4.8 Example 4: Battery Overlay on Push-and-Pull Bass

Snare plays height-controlled taps while bass carries push-and-pull. Ensemble must keep **tap depth** so pulls remain audible.

Count: 1 e & a 2 e & a 3 e & a 4 e & a

Bass: ^ . . > . ^ . . ^ . . > . ^ . .

Snare: . > . . > . . > . > . . > . . >

Sticks: R L R L R L R L R L R L R L R L

Feel: Bass leads push-and-pull; snare reinforces offbeat push without straightening

Pedagogical cue: If snare accents land only on downbeats, the pull vanishes and the example collapses to straight pulse.

4.9 Example 5: Call-and-Response Push — Ensemble

Two-bar question and answer using push-and-pull—relates to [Call and Response](#).

-- Bars 1-2: "Question" (bass push leads) --

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Bass: ^ > ^
Snare:

-- Bars 3-4: "Answer" (ensemble push on & and a) --

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Bass: . . . > ^ > ^ . . .
Snare: . . > > . . > >
Feel: Question pulls back; answer pushes forward into cadence

4.10 Example 6: Straight vs. Push-and-Pull (A/B Listening)

Play these two bass patterns at the same tempo for students and instructors.

A — Straight (not target identity):

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Bass: > . . . > . . . > . . . > . . .

B — Push-and-pull (target identity):

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Bass: ^ . . > . ^ . . ^ . . > . ^ . .

Discussion prompt: Which pattern makes you want to step forward on offbeats? Which sounds like a generic march?

4.11 Common Errors

Error	Symptom	Fix
All push, no pull	Exhausting, monotonous forte	Restore low taps and rests between pushes
Straightening	Snare downbeats override bass syncopation	Write snare to reinforce offbeat pushes
Creeping taps	Pull partials grow loud; groove flattens	Accent-Taps height control
Rushing the pull	Players compress rest space	Count e & a aloud; protect rest duration

4.12 Project Application

- **Sound model:** Core trait of festival-forward groove ([Philippine Percussion Sound Model](#))
- **Warm-ups:** Trained through [Grid Exercises](#) and [Accent-Taps](#) partial shifts
- **Arranging:** Layer A bass must exhibit push-and-pull before Layer B density is added ([Core Blueprint \(Specifications\)](#))
- **Evaluation:** Use [Sound Model evaluation checklist](#)

5 Legato Stroke

Status: Maintained **Owner:** Philippine Marching Percussion Fusion Project
Applies To: Percussion technique, warm-ups, and pedagogy **Last Reviewed:**

5.1 Definition

In percussion practice, **legatos** (often called legato strokes or full strokes) are a fundamental stroke type in which the drumstick or mallet bounces naturally off the drumhead to use maximum rebound.

The goal is a smooth, connected, and resonant sound—mirroring the traditional musical definition of legato (smooth and connected).

5.2 Key Mechanics

5.2.1 Starting Position

The stick begins at a high position (for example 12 inches or vertical).

5.2.2 Downward Motion

The stick is dropped toward the drumhead using a relaxed wrist and fingers.

5.2.3 Rebound

The stick strikes the head and immediately bounces back to the same starting height.

5.2.4 Grip

The hand remains relaxed. The player does not grip tightly or squeeze the stick, which would choke natural resonance and rebound.

5.3 Legatos vs. Accent/Tap Timing

In drumline and percussion pedagogy, legatos are explicitly contrasted with other stroke types to build control. See [Accent-Taps](#) for the accent-tap system and [Grid Exercises](#) for fusion grid pedagogy.

Stroke type	Motion
Legato stroke	Starts high, ends high (uses rebound)

Stroke type	Motion
Down stroke	Starts high, ends low (prepares for a quiet note)
Up stroke	Starts low, ends high (prepares for a loud note)
Tap stroke	Starts low, ends low (inner notes)

5.4 Why Legatos Are Practiced

- **Building velocity:** Players learn to rely on gravity and the drum's natural rebound rather than forcing the stick down.
- **Sound quality:** Legatos produce a full, open, and deep tone from the drumhead, avoiding a choked or pressed sound.
- **Rhythmic consistency:** Regular legato exercises (such as [8-8-16](#) or 8-on-a-hand) help percussionists achieve even timing and uniform stick heights between both hands.

5.5 Common Pitfalls

- **Slicing:** Moving the stick at an angle instead of a straight up-and-down path.
- **Choking the bounce:** Grasping the stick too tightly with the back fingers, which stops it from returning to the initial height.
- **Pumping:** Moving the forearm excessively instead of initiating the stroke from a relaxed wrist hinge.

5.6 Project Application

Legatos are an initial subject in the [Hybrid Warm-Up System \(User Guides\)](#) and foundational to DCI stick-height control taught through Philippine rhythmic vocabulary. See [Core Blueprint — Pedagogy \(Specifications\)](#).

6 Accent-Taps

Status: Maintained **Owner:** Philippine Marching Percussion Fusion Project
Applies To: Percussion technique, warm-ups, and pedagogy **Last Reviewed:**
 2026-07-15 **Review Frequency:** Annual **Authoritative:** Yes

6.1 Definition

In percussion pedagogy, **accent-taps** are a fundamental playing technique and musical structure featuring two distinct dynamic levels: loud notes (**accents**) and quiet notes (**taps**).

The primary challenge is executing sudden volume and stick-height changes efficiently without sacrificing rhythmic accuracy or sound quality.

6.2 Key Mechanics

To master accent-taps, a percussionist must precisely control four foundational stroke types:

Stroke type	Motion	Use
Accent (legato/full stroke)	Starts high, rebounds high	Consecutive accents — see Legato Stroke
Downstroke	Starts high, controlled low after impact	Prepares the hand for an upcoming tap
Tap stroke	Starts low, returns low	Consecutive quiet notes
Upstroke	Starts low, whips upward after impact	Prepares the hand for an upcoming accent

6.3 Exercises and Warm-ups

An effective accent-tap warm-up systematically isolates hand transitions before combining them.

6.3.1 The Classic “Bucks” Exercise

- **Structure:** Alternating measures of isolated hand patterns—for example, a measure of right-hand accents on downbeats with left-hand taps on upbeats, then switching hands.
- **Purpose:** Forces the player to isolate the heavy downstroke from the light tap stroke simultaneously between both hands.

6.3.2 Flaccents (Flam-Accents)

- **Structure:** Alternating accents inside triplet patterns with a low grace note (flam).
- **Purpose:** Builds advanced coordination, ensuring the low grace note does not cause the main accent height to drop.

6.3.3 The Grid System (4-2-1)

- **Structure:** Moving a single accent through a continuous stream of 16th notes or triplets.
- **Purpose:** Trains the brain and muscles to execute downstrokes and upstrokes on every partial of a beat.

For fusion-specific grid exercises (Sinulog-DCI hybrid, HBCU did-its, bass splits), see [Grid Exercises](#).

6.4 16th-Note Accent Grid Notation

6.4.1 Notation Key

Symbol	Meaning
>	Accent (played high, approximately 9”–12”)
.	Tap (played low, approximately 3”)
R	Right hand
L	Left hand

6.4.2 Stroke Notation Key

Stroke labels describe **stick motion**, not whether a note is written. An **upstroke still strikes the head** — it is a low tap that immediately whips upward to prepare for an up-

coming accent.

Label	Stroke type	Motion
Dn	Downstroke	Starts high, ends low — accents
Up	Upstroke	Starts low, ends high — prep tap before an accent
Tp	Tap	Starts low, ends low — inner taps between accents
—	No stroke	That hand does not strike on this partial

Reading rule: R-Str and L-Str align under Sticks. Read only the label on the row that matches the hand in Sticks for that column; the other row shows —. For the full convention (including did-it splits **Tp**–**Tp** and **Tp**–**Up**), see [Grid Exercises — Stroke Notation Key](#).

Below is the standard **16th-note forward grid**. Count out loud (1 e & a) and maintain strict 3" tap heights on all unaccented notes.

6.4.3 Part 1: Accent on the 1st Partial (The Downbeat)

Count: 1 e & a 2 e & a 3 e & a 4 e & a
 Notes: > . . . > . . . > . . . > . . .
 Sticks: R L R L R L R L R L R L R L R L
 R-Str: Dn – Tp – Dn – Tp – Dn – Tp – Dn – Tp –
 L-Str: – Tp – Tp – Tp – Tp – Tp – Tp – Tp – Tp

6.4.4 Part 2: Accent on the 2nd Partial (The “e”)

On every beat, **R plays Up on partial 1** and **L plays Dn on partial e**.

Count: 1 e & a 2 e & a 3 e & a 4 e & a
 Notes: . > . . . > . . . > . . . > . .
 Sticks: R L R L R L R L R L R L R L R L
 R-Str: Up – Tp – Up – Tp – Up – Tp – Up – Tp –
 L-Str: – Dn – Tp – Dn – Tp – Dn – Tp – Dn – Tp

6.4.5 Part 3: Accent on the 3rd Partial (The “&”)

On every beat, **L plays Up on partial e** and **R plays Dn on partial &**.

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Notes: . . > . . . > . . . > .
Sticks: R L R L R L R L R L R L R L R L
R-Str: Tp – Dn – Tp – Dn – Tp – Dn – Tp – Dn –
L-Str: – Up – Tp – Up – Tp – Up – Tp – Up – Tp

6.4.6 Part 4: Accent on the 4th Partial (The “a”)

On every beat, **R plays Up on partial &** and **L plays Dn on partial a**.

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Notes: . . . > . . . > . . . > . . . >
Sticks: R L R L R L R L R L R L R L R L
R-Str: Tp – Up – Tp – Up – Tp – Up – Tp – Up –
L-Str: – Tp – Dn – Tp – Dn – Tp – Dn – Tp – Dn

6.5 Troubleshooting Height Control

Maintaining consistent dynamic contrast is the hardest part of accent-tap pedagogy.

6.5.1 Mistake 1: “Creeping” or “Flowing” Tap Heights

- **Symptom:** Taps gradually get higher and louder as the exercise continues, eventually matching the height of the accents.
- **Fix:** Freeze the sticks after a downstroke. Check that the stick tip rests exactly 3 inches above the drumhead. Do not let the back fingers relax and allow the stick to bounce back up.

6.5.2 Mistake 2: “Pre-Mo” (Premature Motion)

- **Symptom:** Preparing an accent too early by lifting the stick on the tap before the upstroke is required, creating an accidental medium-height note.
- **Fix:** Keep the stick down until the exact partial where the upstroke is required. The upward pull must be a snappy, rhythmic reaction to the tap.

6.5.3 Mistake 3: “Pumping” the Forearm

- **Symptom:** Using the entire arm to drop accents and raise taps, which destroys vertical timing uniformity across the drumline.
- **Fix:** Isolate the wrist hinge. The forearm should remain relatively stable, acting as an anchor while the wrist handles the sudden shift in velocity and angle.

6.6 Importance in Drumlines

- **Dynamic contrast and definition:** Marching percussion relies on extreme clarity. Without clean accent-taps, complex drum parts sound muddy. Distinct heights create sonic space and musicality.
- **Inner-note timing:** A drumline is only as clean as its quietest notes. Accent-tap exercises teach players not to rush or drag unaccented taps, stabilizing ensemble tempo.
- **Stick-height uniformity:** For visual uniformity, every player must match accent heights (for example 12 inches) and tap heights (for example 3 inches). Accent-tap warm-ups synchronize the line visually during rehearsal.
- **Subdivision integrity:** Prevents milking or crushing rhythms. Players often compress 16th-note spaces when transitioning from loud to soft; accent-tap mastery keeps the underlying rhythm mathematically precise.

6.7 Project Application

Accent-taps are an initial subject in the [Hybrid Warm-Up System \(User Guides\)](#). DCI stick-height control in this project is taught through accent groupings influenced by Philippine festival rhythms. See [Core Blueprint — Pedagogy \(Specifications\)](#).

7 8-8-16 Exercise

Status: Maintained **Owner:** Philippine Marching Percussion Fusion Project

Applies To: Percussion technique, warm-ups, and pedagogy **Last Reviewed:**

2026-07-15 **Review Frequency:** Annual **Authoritative:** Yes

7.1 Definition

In percussion pedagogy, the **8-8-16** exercise (and its close cousin, 8-on-a-hand) is the definitive foundational warm-up used across drumlines and marching ensembles worldwide.

Its primary purpose is to establish baseline stroke mechanics, perfect rhythmic subdivision, match stick heights, and balance sound between the right and left hands.

7.2 Key Purpose and Focus Areas

While 8-8-16 appears simple on paper, it is a masterclass in foundational control. Educators use it to evaluate and build four critical pillars:

- **Legato stroke development:** Every note should be a full [legato stroke](#). The stick starts high, drops with relaxed wrist velocity, and bounces naturally back to the exact initial height.
- **Hand-to-hand balance:** The transition between hands must be seamless. The eighth note from the right hand should sound indistinguishable from the eighth note of the left hand in velocity, tone, and volume.
- **Rhythmic integrity:** Trains absolute precision inside the underlying macro-tempo. Players must avoid rushing the end of a hand's pattern or dragging the start of the next sequence.
- **Visual uniformity:** For an entire drumline, it acts as a visual synchronization tool. A technician can instantly see if players are matching vertical stick heights (for example all at 12 inches) and stick paths.

7.3 Standard Musical Structure

The exercise name describes its mathematical layout: **8** counts on the right hand, **8** counts on the left hand, and **16** counts alternating.

7.3.1 Notation Key

Symbol	Meaning
>	Standard legato/full stroke (typically 9", 12", or 15" based on the line's default height)
R	Right hand
L	Left hand

Below is the standard configuration in a continuous stream of eighth notes in 4/4 time.

7.3.2 Measures 1-2: Isolated Hands (The "8-8")

Count: 1 & 2 & 3 & 4 & 1 & 2 & 3 & 4 &
Notes: > > > > > > > > > > > > > >
Sticks: R R R R R R R R L L L L L L L L

7.3.3 Measures 3-4: Alternating Hands (The "16")

Count: 1 & 2 & 3 & 4 & 1 & 2 & 3 & 4 &
Notes: > > > > > > > > > > > > > >
Sticks: R L R L R L R L R L R L R L R L

7.4 Essential Pedagogical Variations

Once a line can play the basic structure perfectly, instructors incorporate variations to isolate specific muscle groups and coordination.

7.4.1 Dynamic Step Grid

- **Routine:** Play the complete 8-8-16 sequence at 3 inches (taps), repeat at 6 inches (piano), repeat at 9 inches (mezzo-forte), and finish at 12 or 15 inches (forte/vertical).

- **Purpose:** Forces the player to understand how wrist velocity changes across different heights while keeping tempo exactly the same.

7.4.2 The Accent-Tap Variation

- **Routine:** Convert the exercise into an accent-tap builder—for example, play the first note of every beat as an accent and the “&” counts as low taps.
- **Purpose:** Tests the line’s ability to drop into downstrokes and lift into upstrokes across hand changes. See [Accent-Taps](#).

7.5 Triplet Variation

This variation shifts the underlying subdivision from straight eighth notes to **eighth-note triplets**. It retains the identical counting framework (8 rights, 8 lefts, 16 alternating) but expands internal time awareness and tests rhythmic vocabulary over a swing or triplet feel.

7.5.1 Measures 1–2: Triplet Isolated Hands

Count:	1	tl	bi	2	tl	bi	3	tl	bi	4	tl	bi	1	tl	bi	2	tl	bi	3	tl	bi	4	tl	bi
Notes:	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>
Sticks:	R	R	R	R	R	R	R	R	R	R	R	R	L	L	L	L	L	L	L	L	L	L	L	L

7.5.2 Measures 3–4: Triplet Alternating Hands

Count:	1	tl	bi	2	tl	bi	3	tl	bi	4	tl	bi	1	tl	bi	2	tl	bi	3	tl	bi	4	tl	bi
Notes:	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>	>
Sticks:	R	L	R	L	R	L	R	L	R	L	R	L	R	L	R	L	R	L	R	L	R	L	R	L

7.6 Flam Accents in the Triplet Framework

The 8-8-16 triplet layout provides a technical environment for introducing **flam accents**. The underlying hand movement of a flam accent is a continuous hand-to-hand triplet (R L L or L R R). Practicing over an 8-8-16 grid keeps timing square.

7.6.1 Step 1: Establish the Accent Structure (No Flams)

Before adding grace notes, ensure hand changes drop cleanly into downstrokes to set up taps.

Count: 1 t1 bi 2 t1 bi 3 t1 bi 4 t1 bi
Notes: > . . > . . > . . > . .
Sticks: R L R L R L R L R L R L

7.6.2 Step 2: Integrate the Low Grace Note (Flam Accent)

Add a quiet grace note (r or l) right before the main accent. The grace note must be played at a 1-inch tap height while the accent strikes from 9 to 12 inches.

Count: 1 t1 bi 2 t1 bi 3 t1 bi 4 t1 bi
Notes: l> . . r> . . l> . . r> . .
Sticks: R L R L R L R L R L R L
Stroke: Down-Tap-Up-----

Pedagogical goal: The left hand must execute a quiet upstroke on the third partial (bi) to prepare for the accent on count 2.

7.7 Marching Bass Drum Split Variations

When applying 8-8-16 to a marching bass drum line, the exercise transitions from an individual stroke check into an ensemble timing and split-orchestration device.

7.7.1 Variation A: The Sequential Run (Straight Down the Line)

Drums enter sequentially every two counts to build rhythmic handoffs. Useful for checking individual velocity balance.

Count: 1 & 2 & 3 & 4 & 1 & 2 & 3 & 4 &
Bass 1: R R R R
Bass 2: R R R R
Bass 3: L L L L
Bass 4: L L L L
Bass 5: Unison/Impact on Count 1 of Next Measure

7.7.2 Variation B: The 4-Bar Interlocking Laser Split (4-Drum Line)

A 4-bar performance map showing how the alternating section splits linearly across a 4-drum configuration. Every note loops down and up the line with zero overlap, demanding absolute time awareness.

7.7.2.1 Bars 1–2: Steady Unisons

Count: 1 & 2 & 3 & 4 & 1 & 2 & 3 & 4 &

B1-B4: > > > > > > > > > > > > > > (All play R then L together)

7.7.2.2 Bars 3–4: The Linear Laser Split

Count: 1 & 2 & 3 & 4 & 1 & 2 & 3 & 4 &

Bass 1: R . . . R . . . R . . . R . . .

Bass 2: . L . . . L L . . . L . . .

Bass 3: . . R . . . R . . . R . . . R . . .

Bass 4: . . . L . . . L . . . L . . . L . . .

7.7.3 Variation C: Unisons vs. Splits (Ensemble Check)

- **Structure:** The isolated 8-8 section is played completely in **unison** (everyone together to match tone, volume, and stick alignment). Upon the alternating 16 section, the line drops into a split flow pattern.
- **Pedagogical value:** Teaches bass drummers to switch instantly from heavy ensemble vertical alignment to independent linear rhythmic contribution.

7.8 Troubleshooting Common Mistakes

Because this exercise is repeated daily, players frequently slide into bad habits.

7.8.1 Mistake 1: The Hand-Change Pause (Gapped Transition)

- **Symptom:** A microscopic pause or hiccup on count 1 of the second measure when shifting from right hand to left hand.
- **Fix:** The left hand must actively prepare its upward motion during the final right-hand stroke. Think of the hand change as a relay baton pass—one hand should not stop tracking before the other begins.

7.8.2 Mistake 2: Weak Hand Drop-off

- **Symptom:** Right-hand counts ring out loud and clear at 12 inches, but the left hand drops to 9 inches with less velocity, altering collective volume.
- **Fix:** Practice in front of a mirror. Visually match the peak height of both sticks. Engage the left wrist hinge with the same relaxed snap as the dominant hand.

7.8.3 Mistake 3: Choking the Rebound on the Alternating Section

- **Symptom:** The isolated 8-8 sections look relaxed, but when the alternating 16 begins, the player panics, squeezes the stick, and pulls the sticks up manually.
- **Fix:** Let the drumhead do the work. The alternating section is simply the 8 motion overlapping. Keep the back fingers loose and allow the sticks to bounce freely.

7.9 Project Application

8-8-16 is an initial subject in the [Hybrid Warm-Up System \(User Guides\)](#). It supports DCI stick-height control taught through Philippine rhythmic vocabulary. See [Core Blueprint — Pedagogy \(Specifications\)](#).

8 Grid Exercises

Status: Maintained **Owner:** Philippine Marching Percussion Fusion Project
Applies To: Percussion technique, warm-ups, and hybrid pedagogy **Last Reviewed:** 2026-07-15 **Review Frequency:** Annual **Authoritative:** Yes

8.1 Purpose

This document is core reference material for grid exercises in the Philippine Marching Percussion Fusion Project. It blends the high-velocity, high-tension hand speed of traditional Philippine Drum & Lyre Corps (DLC) and native festival grooves with the strict stick-height systems of DCI and the high-energy rhythmic syncopation and visual showmanship of HBCU drumlines.

Grid exercises are an initial subject in the [Hybrid Warm-Up System \(User Guides\)](#). For foundational accent-grid notation, see [Accent-Taps](#). For baseline warm-up structure, see [8-8-16 Exercise](#).

8.2 Rhythmic Blueprint: The Fusion Philosophy

Exercises use a **4-2-1 grid framework**. The grid moves an accent systematically across subdivisions, layering native rhythmic textures over modern rudimental frameworks.

8.2.1 Style Elements Integrated

Tradition	Contribution
Philippine DLC / native drumming	Rapid-fire unisons, syncopated festival downbeat accent spacing (similar to Sinulog or Dinagyang grooves), intense rim shots
DCI	Exacting stick-height definition (12" accents vs. 3" taps), perfect dynamic tracking, strict technical uniformity
HBCU	Multi-bounce syncopations, aggressive physical velocity, wrist whip accents, heavy visual presence

This approach supports **modernization without imitation** as defined in the [Identity Framework \(Specifications\)](#).

8.3 Exercise 1: The “Sinulog-DCI Hybrid” 16th-Note Grid

This exercise isolates the [syncopated push-and-pull](#) found in native Visayan festival drumming. It forces the line to maintain precise DCI height controls while navigating an aggressive, syncopated forward-shifting grid.

8.3.1 Structure

- **Bars 1–2 (4-rep phase):** Accents stay on the targeted partial for 4 counts.
- **Bar 3 (2-rep phase):** Accents shift every 2 counts.
- **Bar 4 (1-rep phase / turnaround):** Accents shift on every single count, building high coordination tension.

8.3.2 Performance Key

Symbol	Meaning
^	Accent + rim shot (DLC/HBCU flare) — stick strikes center while shaft hits rim; 12” height
>	Standard accent — 9” to 12” height; full legato or sharp downstroke
.	Inner tap — strict 3” height; controlled, relaxed wrist

8.3.3 Stroke Notation Key

Stroke labels describe **stick motion**, not whether a note is written. An **upstroke still strikes the head** — it is a low tap that immediately whips upward to prepare for an upcoming accent. See [Accent-Taps](#) for full stroke-type definitions.

Label	Stroke type	Motion
Dn	Downstroke	Starts high, ends low — accents
Up	Upstroke	Starts low, ends high — prep tap before an accent

Label	Stroke type	Motion
Tp	Tap	Starts low, ends low — inner taps between accents
—	No stroke	That hand does not strike on this partial
Tp□Tp	Did-it	Low double: first stroke tap, second stroke tap
Tp□Up	Did-it + prep	Low double: first stroke tap, second stroke upstroke (prep for next accent)

Reading rule: R-Str and L-Str align under Sticks. Read only the label on the row that matches the hand in Sticks for that column; the other row shows —. Compound patterns such as Up-then-Dn span two consecutive partials — the first partial gets **Up**, the second gets **Dn**, each on the striking hand for that column. Did-its (xr / ll) occupy one column but are two strokes; use **Tp□Tp** or **Tp□Up** to show how the double finishes.

Time Signature: 4/4

Subdivision: 16th Notes (1 e & a 2 e & a...)

8.3.4 Part A: Downbeat Foundations (The Root Festival Pulse)

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Notes: ^ . . . > . . . ^ . . . > . . .
Sticks: R L R L R L R L R L R L R L R L
R-Str: Dn — Tp — Dn — Tp — Dn — Tp — Dn — Tp —
L-Str: — Tp — Tp — Tp — Tp — Tp — Tp — Tp — Tp

8.3.5 Part B: The Syncopated Offbeat (The “e” Shift)

This variation mimics traditional native kettle-drum answer patterns. On every beat, **R plays a lightning-fast upstroke tap on partial 1** (low hit, stick whips up within one 16th note). **L plays the accent on partial e with a downstroke**. If R’s recovery is slow, heights blur and the offbeat accent loses its snap.

Count: 1 e & a 2 e & a 3 e & a 4 e & a
Notes: . > . . . ^ . . . > . . . ^ . .

Sticks: R L R L R L R L R L R L R L R L
 R-Str: Up – Tp – Up – Tp – Up – Tp – Up – Tp –
 L-Str: – Dn – Tp – Dn – Tp – Dn – Tp – Dn – Tp

Beat 1 walkthrough

Partial	Hand	Note	Stroke	Height
1	R	. tap	Up	3" hit □ stick recovers high immediately
e	L	> accent	Dn	9"–12" from high prepare position
&	R	. tap	Tp	3", stay low
a	L	. tap	Tp	3", stay low

8.3.6 Part C: The Complete 4-2-1 Turnaround (Ensemble Check)

This bar pushes the line through rapid height switches. It tests whether players are milking (blurring) the line between 12" accents and 3" taps.

Count: 1 e & a 2 e & a 3 e & a 4 e & a
 Notes: ^ > ^ >
 Sticks: R L R L R L R L R L R L R L R L
 R-Str: Dn – Tp – Up – Tp – Tp – Dn – Tp – Up –
 L-Str: – Up – Tp – Dn – Tp – Up – Tp – Tp – Dn

Beat	Accent partial	Accent hand	Prep (Up)	Accent (Dn)
1	1	R	—	R Dn on 1
1	—	L	L Up on e (sets up beat 2)	—
2	e	L	R Up on 1	L Dn on e
3	&	R	L Up on e	R Dn on &
4	a	L	R Up on &	L Dn on a

8.4 Exercise 2: The “HBCU Flash” Triplet Grid with Did-Its

Traditional Philippine lyre corps rely on dense, rapid multi-note patterns. This grid takes a standard DCI triplet grid and modifies it with **HBCU-style did-its (double strokes)** on unaccented partials, adding volume depth and low-end texture to the battery.

8.4.1 Notation Key

Symbol	Meaning
>	Accented single stroke (9"–12")
rr / ll	Low double-stroke / did-it (3" tap height) — two strokes in one column; see Tp→Tp and Tp→Up in Stroke Notation Key

Stroke labels use the same R-Str / L-Str convention as [Exercise 1 — Stroke Notation Key](#). Only the hand shown in Sticks plays on that partial; the other stroke row shows —.

8.4.2 Part 1: Accent on the 1st Partial (Downbeat Driving Pulse)

Count: 1 t1 bi 2 t1 bi 3 t1 bi 4 t1 bi
 Notes: > ll rr > rr ll > ll rr > rr ll
 Sticks: R L R L R L R L R L R L
 R-Str: Dn — Tp→Tp — Tp→Tp — Dn — Tp→Tp — Tp→Tp —
 L-Str: — Tp→Tp — Dn — Tp→Tp — Tp→Tp — Dn — Tp→Tp

8.4.3 Part 2: Accent on the 2nd Partial (The Upbeat Flow)

Extremely difficult for tracking uniform stick heights, as the accenting hand must pop out of a low did-it into a high accent. On partial 1, the did-it is **Tp→Up** (first stroke tap, second stroke upstroke prep). The accenting hand on partial t1 plays **Dn**.

Count: 1 t1 bi 2 t1 bi 3 t1 bi 4 t1 bi
 Notes: rr > rr ll > ll rr > ll ll > ll
 Sticks: R L R L R L R L R L R L
 R-Str: Tp→Up — Tp→Tp — Dn — Tp→Up — Tp→Tp — Dn —
 L-Str: — Dn — Tp→Up — Tp→Tp — Dn — Tp→Up — Tp→Tp

Beat 1 walkthrough

Partial	Hand	Note	Stroke	Detail
1	R	rr did-it	Tp→Up	1st r = Tp; 2nd r = Up (prep for L accent on t1)

Partial	Hand	Note	Stroke	Detail
t1	L	> accent	Dn	9"–12" from high prepare position
bi	R	rr did-it	Tp□Tp	both strokes stay low — no accent follows on next partial 1

8.5 Exercise 3: Bass Drum “Linear Fiesta” Split Grid

For a 5-drum marching bass line, this split grid transforms a standard 16th-note check into an interlocking native rhythmic matrix. It uses a syncopated, bouncing regional pattern split sequentially and in unison chunks.

Ensemble goal: The composite sound of all 5 drums combined must sound like a single, perfectly smooth individual running a 16th-note accent grid.

Count: 1 e & a 2 e & a 3 e & a 4 e & a

Bass 1: > > (High Tension / Rim Fire)

Bass 2: . > >

Bass 3: . . > . . > > . . > . . (The Syncopated Engine)

Bass 4: . . . > . . > > . . > .

Bass 5: > . . > > . . > (Bottom End / Festival Low)

8.6 Troubleshooting and Field Pedagogy

8.6.1 Pitfall 1: The DLC Flat-Hand Trap

- **Symptom:** Performers from traditional older-style Philippine Drum & Lyre lines use a stiff, arm-driven stroke with flat wrists. This chokes rebound and leads to dirtiness on fast grid shifts.
- **Fix:** Reinforce the DCI wrist-hinge foundation. Have players isolate the rebound check by letting the stick bounce unrestricted to vertical after every accent, using only the wrist hinge. See [Legato Stroke](#).

8.6.2 Pitfall 2: Over-Squeezing the Did-Its

- **Symptom:** On the HBCU-style triplet grid, players muscle the low double strokes (11 and 11), pushing tap heights past 3 inches and distorting syncopated accent space.
- **Fix:** Achieve low double strokes using natural head resonance. Keep back fingers gently wrapped but loose on the stick handle. Let the stick take a small micro-bounce for the second note of the double without lifting the wrist.

8.7 Project Application

Grid exercises apply the three-layer arranging method from the [Core Blueprint \(Specifications\)](#): Philippine festival soul (Layer A), DCI precision (Layer B), and HBCU contrast (Layer C). DCI stick-height control is taught through accent groupings influenced by Philippine festival rhythms.
