0.1 Manual volumes in this release

PDF	Description
00-Trainers-Manual.pdf	Field teaching handbook for instructors and pilot collaborators
01-Specifications.pdf	Identity framework, blueprint, design principles, notation standards
02-Reference.pdf	Concept library, technique, grids, sound model
03-User-Guides.pdf	Instructor, pilot, arranging, and educational guidance
04-Research.pdf	Indigenous percussion, Kaamulan, marching heritage
05-Architecture.pdf	Documentation architecture and ADRs
06-Governance.pdf	EDF governance, metadata, change management
07-AI-Development.pdf	AI-assisted workflow and project development notes
08-Templates-and-Placeholders.pdf	Templates and inactive EDF domain placeholders
09-Student-Practice-Guide.pdf	Student orientation and embedded technique reference

1 Governance

Status: Maintained **Owner:** Philippine Marching Percussion Fusion Project **Applies To:** This repository **Last Reviewed:** 2026-07-11 **Review Frequency:** Annual

1.1 Purpose

This domain defines how project documentation is owned, reviewed, maintained, deprecated, archived, and validated.

Baseline governance practices are adopted from the [Engineering Documentation Framework](#). Project-specific rules and accepted exceptions are defined in [Project Governance](#).

1.2 Governance Documents

1.2.1 Project-Authoritative

- [Project Governance](#) — rules specific to this repository
- [Governance Overview](#)
- [Document Metadata Standard](#)
- [Document Lifecycle](#)
- [Ownership and Review](#)
- [Documentation Change Management](#)
- [Governance Analyzer Compliance](#)
- [Governance Checklist](#)

1.2.2 EDF Reference (Not Project-Operational)

These documents are retained as upstream EDF reference copies. They govern EDF repository maintenance, not routine work in this project:

- [EDF Governance](#)
- [Framework Self-Hosting](#)

1.3 Parent

- Project Index (*Project Index (GitHub repository root)*)

1.4 Related Documents

- [Documentation Architecture \(Architecture\)](#)
- [AI Repository Workflow \(AI and Development\)](#)
- EDF Adoption Guide (*not included in PDF manual; see project repository*)
- [Development \(AI and Development\)](#)

2 Governance Overview

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** EDF and adopting projects **Last Reviewed:** 2026-07-10 **Review Frequency:** Annual

2.1 Applicability

This document defines baseline governance that applies to:

- the Engineering Documentation Framework repository
- projects that adopt the Engineering Documentation Framework

EDF itself follows this baseline governance and also follows the additional framework-specific requirements in [EDF Governance](#).

2.2 Purpose

Governance ensures that documentation remains authoritative, discoverable, reviewable, current, and aligned with the project it describes.

Governance complements the documentation information architecture by defining how documents are managed throughout their lifecycle.

2.3 Governance Layers

EDF uses two governance layers.

2.3.1 Baseline Governance

Baseline governance applies to both the Engineering Documentation Framework and projects that adopt it. It covers document metadata, lifecycle, ownership, review, change management, analyzer expectations, and governance checks.

2.3.2 EDF-Specific Governance

EDF-specific governance applies only to development and maintenance of the Engineering Documentation Framework repository. It extends the baseline with rules for templates, generators, the Framework Advisor, framework governance documents, self-hosting, versioning, and releases.

See [EDF Governance](#) for the framework-specific extension.

2.4 Governance Principles

1. Every authoritative document has a clearly identified owner.
2. Every governed document has an explicit lifecycle state.
3. Review frequency is proportional to the document's risk and rate of change.
4. Project facts must not be invented or inferred without evidence.
5. Significant documentation changes require traceable review.
6. Deprecated documents remain discoverable until they are archived.
7. Archived documents are preserved but removed from normal navigation.
8. Automation may analyze and recommend, but must not silently alter project-owned content.
9. Governance rules should be configurable where project needs differ.
10. Human approval remains the final authority.

2.5 Scope

Governance applies to:

- canonical documentation
- policies
- architecture documents
- specifications
- operational guides
- developer documentation
- user documentation
- templates when they define project-facing standards

Governance may be lighter for:

- temporary notes
- working drafts
- generated reports
- disposable migration artifacts

2.6 Governance Model

Create
↓
Draft
↓
Review
↓
Approved
↓

Maintained

↓

Deprecated

↓

Archived

Not every document must pass through every state, but authoritative documents must reach an approved or maintained state before being treated as canonical.

2.7 Enforcement Model

Governance begins as advisory.

The Framework Advisor should:

- identify missing metadata
- identify overdue reviews
- identify documents without owners
- identify invalid lifecycle states
- identify canonical documents with unresolved review status
- recommend corrective action

Projects may later choose stricter enforcement in CI or release workflows.

2.8 Parent

- [Governance](#)

2.9 Child Documents

- [Project Governance](#)
- [Document Metadata Standard](#)
- [Document Lifecycle](#)
- [Ownership and Review](#)
- [Documentation Change Management](#)
- [Governance Analyzer Compliance](#)
- [Governance Checklist](#)

2.10 Related Documents

- [Documentation Architecture \(Architecture\)](#)
- [Development \(AI and Development\)](#)

3 Project Governance

Status: Maintained **Owner:** Philippine Marching Percussion Fusion Project **Applies To:** This repository only **Last Reviewed:** 2026-07-11 **Review Frequency:** Quarterly **Authoritative:** Yes

3.1 Purpose

This document defines governance requirements specific to the Philippine Marching Percussion Fusion Project.

It supplements the baseline governance documents adopted from the [Engineering Documentation Framework](#). Baseline rules for metadata, lifecycle, ownership, review, and change management remain in force unless this document states a project-specific exception.

3.2 Domain Profile

This project implements a **music-education domain profile** on top of EDF Core. It is an educational and musical initiative, not a conventional software repository.

The project preserves EDF navigation, traceability, and governance practices while extending the documentation model for:

- musical scores and notation
- practice and presentation audio
- curated reference material
- project branding and shared visual assets
- music-education research
- arranging and pedagogy documentation

See [Documentation Architecture \(Architecture\)](#) and EDF Adoption Guide (*not included in PDF manual; see project repository*).

3.3 Authoritative Sources

Source	Role
GitHub (main branch)	Canonical source of truth for all project content
PROJECT_INDEX.md	Primary navigation hub for humans and AI assistants
docs/Specifications/	Authoritative musical, educational, and design intent
scores/ and audio/	Finished musical deliverables
references/	Curated inspiration and source material
assets/	Canonical branding and shared visual assets

3.4 Document Ownership

The project owner is accountable for:

- accuracy of specifications, guides, and educational content
- cultural authenticity of musical and pedagogical decisions
- navigation integrity across docs/, deliverable areas, and root indexes
- review of AI-assisted documentation and score-related changes

Baseline governance documents in this domain were adopted from EDF. When EDF upstream guidance and project needs conflict, this document and [Documentation Architecture \(Architecture\)](#) take precedence for this repository.

3.5 EDF Domains Not Used

The following EDF Core domains are retained as structural placeholders only. They are **not active** for this project:

Domain	Reason
docs/API/	No application programming interface
docs/Database/	No database or persistence layer
docs/Deployment/	No software deployment pipeline

Do not place project documentation in these domains unless the project's nature changes.

3.6 Accepted Deliverable Areas

The Framework Advisor may report Markdown under `scores/`, `audio/`, `references/`, `reports/`, and `assets/` as outside canonical `docs/` locations. This is expected and accepted.

These paths are deliberate project extensions documented in [Documentation Architecture \(Architecture\)](#). They must remain linked from `PROJECT_INDEX.md` and include hierarchical navigation breadcrumbs.

3.7 AI-Assisted Work

AI-assisted changes to this repository follow [AI Repository Workflow \(AI and Development\)](#).

Key requirements:

- work directly in the local Git working tree
- deliver complete files at normal repository paths
- update navigation when documents change
- preserve Philippine musical identity in all creative and educational content
- treat the human project owner as the final authority

3.8 Validation

This project does not host EDF Framework Advisor scripts. Validation is performed read-only from a local clone of the Engineering Documentation Framework repository:

```
/path/to/Engineering-Documentation-Framework/scripts/analyze_project_structure.sh \  
"/path/to/01_PH-Marching-Fusion-Project"
```

Analyzer recommendations about `scores/`, `audio/`, `references/`, `reports/`, and `assets/` may be accepted as documented exceptions above. Recommendations about missing `docs/AI/` or governance completeness should be resolved.

3.9 Framework Reference Documents

The following documents are retained as **reference copies** of EDF upstream guidance. They apply to EDF repository maintenance, not to day-to-day work in this project:

- [EDF Governance](#)
- [Framework Self-Hosting](#)

3.10 Review Expectations

Document class	Review frequency
Specifications and Core Blueprint	On change
AI Repository Workflow	On change
Educational and arranging guides	Quarterly or on change
Scores and audio deliverables	On revision
Governance and adoption docs	Quarterly

3.11 Parent

- [Governance](#)

3.12 Related Documents

- [Governance Overview](#)
- [Document Metadata Standard](#)
- [Documentation Change Management](#)
- [AI Repository Workflow \(AI and Development\)](#)
- EDF Adoption Guide (*not included in PDF manual; see project repository*)

4 EDF Governance

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** Engineering Documentation Framework repository only **Last Reviewed:** 2026-07-10
Review Frequency: Annual

Note: This is an EDF upstream reference copy. For day-to-day governance of this project, see [Project Governance](#).

4.1 Applicability

This document applies only to development, maintenance, validation, and release of the Engineering Documentation Framework itself.

Projects that adopt EDF are not required to maintain EDF templates, generators, analyzers, framework governance documents, self-hosting checks, or EDF release artifacts unless they independently choose to implement comparable tooling.

Adopting projects remain subject to the baseline governance documents in this domain.

4.2 Purpose

This document extends the baseline Governance subsystem with requirements that are specific to EDF as a reusable framework.

4.3 Template Governance

Changes to canonical documentation standards must be evaluated for corresponding template changes.

Template changes must:

- preserve non-destructive generation behavior
- avoid overwriting project-owned files
- include required navigation
- reflect current metadata and governance standards
- remain suitable for both new and existing projects

4.4 Generator Governance

EDF generators must:

- create only missing files
- never overwrite existing project-owned files
- never delete, rename, move, or merge project-owned files automatically
- create complete navigation when generating documents
- clearly report created and skipped files
- remain consistent with the canonical templates and architecture

Changes to generator behavior require review against the non-destructive generation principles.

4.5 Framework Advisor Governance

The Framework Advisor must:

- remain read-only unless a future explicitly approved mode says otherwise
- explain findings and recommendations
- distinguish baseline project checks from EDF-specific checks
- avoid inventing project facts, owners, approvals, or exceptions
- use transparent scoring rules
- report accepted exceptions separately from unresolved noncompliance

EDF-specific checks may include:

- template completeness
- generator-template alignment
- analyzer-governance alignment
- framework self-hosting compliance
- required framework documents
- release-readiness validation

4.6 Governance-System Governance

Changes to Governance itself must:

- preserve the distinction between baseline governance and EDF-specific governance
- update affected templates, generators, analyzer rules, and navigation
- be recorded in architecture decisions when they alter governance direction
- be reflected in the changelog when release-significant

4.7 Self-Hosting Governance

Before a stable EDF release, the EDF repository should be evaluated against its own:

- canonical structure
- navigation requirements
- metadata standards
- lifecycle rules
- ownership and review rules
- link-validation requirements
- analyzer requirements
- template requirements

Accepted exceptions must be documented and must not be hidden by scoring.

4.8 Versioning Governance

Framework releases should identify:

- the framework version
- significant governance changes
- template changes
- generator changes
- analyzer changes
- migration considerations
- compatibility expectations

Breaking changes to canonical structure, metadata meaning, or required behavior should be clearly identified.

4.9 Release Governance

An EDF release should not be considered complete until:

- required documentation is current
- navigation links are validated
- framework-specific analyzer checks are reviewed
- self-hosting results are acceptable
- architecture decisions are recorded
- the changelog is updated
- a human maintainer approves the release

4.10 Maintenance Responsibility

The EDF maintainer is responsible for ensuring that framework components remain internally consistent.

This includes alignment among:

- architecture
- governance
- templates
- generators
- Framework Advisor behavior
- adoption guidance
- release documentation

4.11 Parent

- [Governance](#)

4.12 Related Documents

- [Governance Overview](#)

- [AI Repository Workflow \(AI and Development\)](#)
- [Documentation Architecture \(Architecture\)](#)

5 Document Metadata Standard

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** Governed Markdown documents **Last Reviewed:** 2026-07-10 **Review Frequency:** Annual

5.1 Purpose

This standard defines the minimum metadata required to govern engineering documentation consistently.

5.2 Initial Representation

Until EDF adopts a machine-readable front-matter format, metadata should be written as a Markdown block immediately below the document title.

```
> **Status:** Draft
> **Owner:** Team or role
> **Applies To:** Project, subsystem, or audience
> **Last Reviewed:** YYYY-MM-DD
> **Review Frequency:** Annual
> **Authoritative:** Yes
```

[## Applicability](#)

This document defines baseline governance that applies to:

- the Engineering Documentation Framework repository
- projects that adopt the Engineering Documentation Framework

EDF itself follows this baseline governance and also follows the additional framework-specific requirements in [\[EDF Governance\]](#) ([#edf-governance](#)).

5.3 Required Fields

Field		Required	Purpose
Status		Yes	Identifies the lifecycle state
Owner		Yes	Identifies the accountable role or group
Applies To		Yes	Defines scope
Last Reviewed	Yes for approved or maintained documents		Records the most recent substantive review
Review Frequency	Yes for governed documents		Defines the expected review interval
Authoritative	Yes for canonical candidates		Distinguishes source documents from supporting material

5.4 Optional Fields

Field	Purpose
Version	Document-specific version when needed
Approver	Required approval authority
Approved On	Date approval was granted
Supersedes	Document replaced by this one
Superseded By	Replacement document
Related ADRs	Links to applicable decisions
Security Classification	Handling requirements
Review Notes	Context for the next review

5.5 Valid Status Values

- Draft
- In Review
- Approved
- Maintained
- Deprecated
- Archived

5.6 Owner Values

The owner should normally be a stable role or team, not an individual person.

Preferred:

Architecture Team

Project Maintainer

Security Owner

Documentation Owner

Engineering Documentation Framework

Avoid using a named individual unless the project is intentionally maintained by one person and no stable role exists.

5.7 Authoritative Values

Use:

- **Yes** for the canonical source of a concept
- **No** for supporting, derived, or informational content

A concept should normally have only one authoritative document.

5.8 Review Frequency Values

Recommended values:

- Monthly
- Quarterly
- Semiannual
- Annual
- Per Release
- On Change
- Not Scheduled

Not Scheduled should be limited to drafts, archives, or low-risk reference material.

5.9 Machine-Readable Future

A later EDF version may introduce YAML front matter or a repository governance manifest. The semantic meaning defined here should remain stable even if the serialization format changes.

5.10 Parent

- [Governance](#)

5.11 Related Documents

- [Governance Overview](#)

- [Ownership and Review](#)
- [Governance Analyzer Compliance](#)

6 Document Lifecycle

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:**
Governed documentation **Last Reviewed:** 2026-07-10 **Review Frequency:** Annual

6.1 Applicability

This document defines baseline governance that applies to:

- the Engineering Documentation Framework repository
- projects that adopt the Engineering Documentation Framework

EDF itself follows this baseline governance and also follows the additional framework-specific requirements in [EDF Governance](#).

6.2 Purpose

This document defines the lifecycle states used to manage engineering documentation.

6.3 Lifecycle States

6.3.1 Draft

The document is incomplete, provisional, or actively being authored.

Draft documents:

- may contain unresolved questions
- are not authoritative
- should not be relied upon for production decisions

6.3.2 In Review

The document is ready for substantive review.

Review should confirm:

- factual accuracy
- architectural consistency
- link integrity
- ownership
- scope
- approval requirements

6.3.3 Approved

The document has received the required approval and may be treated as authoritative.

Approval does not mean the document is permanently complete.

6.3.4 Maintained

The document is approved, actively used, and subject to ongoing review.

Canonical documents should normally be in the Maintained state.

6.3.5 Deprecated

The document should no longer guide new work but remains available for transition, history, or compatibility.

Deprecated documents must identify:

- the reason for deprecation
- the replacement document, when one exists
- the effective date

6.3.6 Archived

The document is retained for historical or compliance purposes and is removed from normal project navigation.

Archived documents must not be treated as current guidance.

6.4 Allowed Transitions

Draft → In Review

In Review → Draft

In Review → Approved

Approved → Maintained

Maintained → In Review

Maintained → Deprecated

Deprecated → Maintained

Deprecated → Archived

Direct transitions may be used for low-risk documentation when governance policy permits.

6.5 Canonical Document Rule

A document must not be marked authoritative while its status is Draft or Archived.

6.6 Deprecation Rule

A deprecated authoritative document should identify a replacement or explicitly state that no replacement exists.

6.7 Archive Rule

Archiving must not delete project history. Moving files may be performed only through an explicit human-approved change.

6.8 Parent

- [Governance](#)

6.9 Related Documents

- [Governance Overview](#)
- [Document Metadata Standard](#)
- [Ownership and Review](#)
- [Documentation Change Management](#)

7 Documentation Change Management

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** Significant documentation changes **Last Reviewed:** 2026-07-10 **Review Frequency:** Annual

7.1 Applicability

This document defines baseline governance that applies to:

- the Engineering Documentation Framework repository
- projects that adopt the Engineering Documentation Framework

EDF itself follows this baseline governance and also follows the additional framework-specific requirements in [EDF Governance](#).

7.2 Purpose

This policy defines how significant documentation changes are proposed, reviewed, recorded, and accepted.

7.3 Significant Changes

A documentation change is significant when it affects:

- architecture
- public behavior
- interfaces
- governance
- security
- operational procedures
- ownership
- lifecycle state
- canonical navigation
- authoritative status

7.4 Required Change Sequence

1. Identify the authoritative document.
2. Update architecture or policy before implementation when applicable.
3. Update affected cross-references.
4. Review the change.
5. Validate links and navigation.
6. Record the decision when architectural.
7. Update the changelog when release-significant.
8. Commit the change atomically when practical.

7.5 Architectural Decisions

Changes that establish or reverse architectural direction should be recorded in `ARCHITECTURE_DECISIONS.md` or in the project's ADR system.

7.6 Non-Destructive Rule

Automated tools must not:

- overwrite existing project-owned files
- delete files

- rename files
- move files
- merge competing documents automatically

They may generate recommendations or new files with explicit user approval.

7.7 Emergency Changes

Urgent operational or security corrections may be implemented before full documentation review when delay would create greater risk.

The documentation and decision record should be corrected as soon as practical afterward.

7.8 Parent

- [Governance](#)

7.9 Related Documents

- [Governance Overview](#)
- [Document Lifecycle](#)
- [Development \(AI and Development\)](#)
- [AI Repository Workflow \(AI and Development\)](#)

8 Ownership and Review

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** Governed documentation **Last Reviewed:** 2026-07-10 **Review Frequency:** Annual

8.1 Applicability

This document defines baseline governance that applies to:

- the Engineering Documentation Framework repository
- projects that adopt the Engineering Documentation Framework

EDF itself follows this baseline governance and also follows the additional framework-specific requirements in [EDF Governance](#).

8.2 Purpose

This policy defines accountability for documentation and establishes review expectations.

8.3 Ownership Responsibilities

The document owner is accountable for:

- maintaining factual accuracy
- ensuring the document remains discoverable
- initiating required reviews
- resolving conflicting authoritative sources
- approving or obtaining approval for deprecation

- ensuring links and relationships remain valid

Ownership does not require the owner to author every change.

8.4 Preferred Ownership Model

Use stable roles or teams whenever possible.

Examples:

- Project Maintainer
- Architecture Owner
- API Owner
- Database Owner
- Security Owner
- Operations Owner
- Documentation Owner

8.5 Review Frequency Guidance

Document Type	Suggested Frequency
Security policy	Quarterly or On Change
Deployment or operations guide	Quarterly
API specification	Per Release or On Change
Architecture document	Semiannual or On Change
Developer guide	Semiannual
User guide	Per Release
Project charter	Annual
Archived document	Not Scheduled

Projects may choose stricter intervals.

8.6 Review Outcomes

A review should result in one of the following:

- confirmed current
- updated
- returned to Draft
- marked Deprecated
- archived through an approved change

8.7 Overdue Reviews

A review is overdue when:

Last Reviewed + Review Frequency < Current Date

The Framework Advisor should report overdue reviews as recommendations and identify the responsible owner.

8.8 Approval Requirements

Projects should define approval requirements based on risk.

Human approval should be mandatory for:

- architectural decisions
- security policies
- production procedures
- governance policies
- destructive migration guidance
- legal or compliance documentation

8.9 Missing Owners

A governed document without an owner is noncompliant.

The analyzer should recommend an owner category but must not invent or assign one without project approval.

9 Governance Checklist

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** Governance reviews **Last Reviewed:** 2026-07-10 **Review Frequency:** Annual

9.1 Document-Level Checklist

- ☐ The document has a valid status.
- ☐ The document has an owner.
- ☐ The document identifies its scope.
- ☐ The authoritative status is explicit when applicable.
- ☐ The last-reviewed date is present when required.
- ☐ The review frequency is defined.
- ☐ The document links to its parent.
- ☐ Related authoritative documents are linked.
- ☐ The content does not duplicate another authoritative source.
- ☐ Deprecated content identifies a replacement or states that none exists.
- ☐ Archived content is absent from active navigation.

9.2 Repository-Level Checklist

- ☐ Governance documents exist.
- ☐ Governance is linked from PROJECT_INDEX.md.
- ☐ Canonical documents have owners.
- ☐ Canonical documents have valid lifecycle states.
- ☐ No conflicting authoritative sources exist.
- ☐ Overdue reviews are identified.
- ☐ Broken governance links are identified.
- ☐ Exceptions are documented.
- ☐ Analyzer output is advisory and explains recommendations.
- ☐ Automated tools remain non-destructive.

9.3 Release Checklist

- ☐ Governance changes are recorded in the changelog.
- ☐ Architectural governance decisions are recorded.
- ☐ Navigation is valid.
- ☐ Required approvals are complete.

9.4 Parent

- [Governance](#)

9.5 Related Documents

- [Governance Overview](#)
- [Document Metadata Standard](#)
- [Document Lifecycle](#)
- [Ownership and Review](#)
- [Documentation Change Management](#)
- [Governance Analyzer Compliance](#) ## Framework Advisor M3

- ☐ PowerShell analyzer completes without modifying files.
- ☐ Bash analyzer completes without modifying files.
- ☐ Broken relative links are reported.
- ☐ Orphan documents are reported.
- ☐ Missing hierarchical navigation is reported.
- ☐ Invalid lifecycle metadata is reported.
- ☐ Missing ownership and review metadata is reported.
- ☐ Overdue reviews are reported.
- ☐ Structure, AI, navigation, governance, and overall scores are displayed.

10 Governance Analyzer Compliance

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** Framework Advisor and compatible analyzers **Last Reviewed:** 2026-07-10 **Review Frequency:** Annual

10.1 Purpose

This specification defines governance checks that the Framework Advisor should support.

10.2 Initial Checks

The analyzer should detect:

- missing required metadata
- invalid lifecycle states
- missing owners
- missing review frequency
- missing last-reviewed date
- overdue reviews
- multiple authoritative documents for the same declared concept
- authoritative documents in Draft or Archived status
- deprecated documents without replacement information
- archived documents present in active navigation
- missing parent links
- missing related-document links where required
- governance documents missing from project navigation

10.3 Severity Model

10.3.1 Informational

A useful observation that does not indicate noncompliance.

10.3.2 Recommendation

A governance improvement should be considered.

10.3.3 Warning

A governance requirement is not satisfied or may create ambiguity.

10.3.4 Critical

A condition creates significant risk, such as conflicting authoritative sources or missing governance for security-critical documentation.

10.4 Advisory Behavior

The analyzer must explain:

- what was found

- why it matters
- which rule applies
- the recommended corrective action

The analyzer must not change project-owned content automatically.

10.5 Scoring

A future governance score may consider:

- metadata completeness
- ownership coverage
- review currency
- lifecycle validity
- canonical-source consistency
- navigation compliance

Scoring formulas should be transparent and configurable.

10.6 Configuration

Checks should eventually be controlled through EDF configuration so projects can:

- enable or disable checks
- adjust severity
- define required document classes
- define review intervals
- define exceptions

10.7 Exceptions

Accepted exceptions should be explicit, documented, scoped, and reviewable.

The analyzer should distinguish accepted exceptions from unreviewed noncompliance.

- [Governance Checklist](#) ## M3 Implemented Checks

The PowerShell and Bash Framework Advisor scripts implement:

- canonical structure validation
- AI handbook completeness
- Governance-domain completeness
- broken relative Markdown-link detection
- orphan-document detection

- breadcrumb and parent-navigation validation
- lifecycle-status validation
- owner and applicability validation
- last-reviewed and review-frequency validation
- overdue-review detection
- authoritative Draft or Archived-state detection
- deprecated-document replacement validation
- structure, AI, navigation, governance, and overall scores

External links, semantic duplication, and factual contradictions remain outside the M3 implementation.

11 Framework Self-Hosting

Status: Maintained **Owner:** Engineering Documentation Framework **Applies To:** Engineering Documentation Framework repository only **Last Reviewed:** 2026-07-10 **Review Frequency:** Per Release **Authoritative:** Yes

Note: This is an EDF upstream reference copy. This project validates using the external EDF Framework Advisor. See [Project Governance](#).

11.1 Applicability

This document applies only to the Engineering Documentation Framework repository.

Projects adopting EDF may use the same validation approach, but they are not required to satisfy EDF-specific template, generator, analyzer, self-hosting, or release rules.

11.2 Purpose

Self-hosting requires EDF to apply its own documentation architecture, governance, navigation, analyzer, and non-destructive tooling standards to the EDF repository.

11.3 Requirements

EDF must validate:

- canonical repository structure
- required root documents
- AI handbook completeness
- Governance-domain completeness
- hierarchical Markdown navigation
- relative Markdown links
- orphan documents
- metadata and lifecycle validity
- ownership and review metadata
- overdue reviews

- analyzer read-only behavior
- PowerShell and Bash analyzer behavior
- accepted exceptions
- release readiness

11.4 Validation Commands

11.4.1 Bash

From the repository root, run:

```
./scripts/run_self_hosting_validation.sh
```

This is the normal macOS and Linux workflow. The wrapper automatically:

1. runs the Framework Advisor Stage 1 regression verification
2. validates Bash 3.2 compatibility and shell-script requirements
3. runs the Framework Advisor against the EDF repository
4. captures the complete output in a timestamped text report

If the wrapper is not executable, invoke it explicitly:

```
bash ./scripts/run_self_hosting_validation.sh
```

The `chmod` and `git update-index --chmod` commands are one-time repository setup actions, not part of every validation run.

11.4.2 PowerShell

```
.\scripts\run_self_hosting_validation.ps1
```

Each runner writes a timestamped report under:

```
reports/self-hosting/
```

11.5 Report Handling

The generated report is a project record and should be reviewed and committed to Git when it documents an implementation milestone or release-validation result.

11.6 Pass Criteria

A stable EDF release requires:

- no unresolved critical findings
- no broken internal links
- no unexplained orphan canonical documents
- no invalid canonical lifecycle states
- no missing ownership on governed canonical documents
- no hidden accepted exceptions
- successful analyzer execution
- human review of the generated report

A numeric score is not a substitute for reviewing findings.

11.7 Accepted Exceptions

Every accepted exception must identify:

- affected rule
- rationale
- owner
- approval
- review date
- resolution plan or permanent-exception status

11.8 Release Gate

M5 release preparation must reference the latest reviewed self-hosting report.

EDF must not claim self-hosting compliance until the local report has been generated and reviewed by the maintainer.
